*Dash Python > Embed Your Dash App in Other Websites*

Embedding Dash Apps in Other Web Platforms

Our recommend method for securely embedding Dash apps in existing web apps is to use the **Embedding Middleware** of Dash Enterprise.

Dash Enterprise can be installed on the Kubernetes services of **AWS**, **Azure**, or **Google Cloud**.

[Find out if your company is using Dash Enterprise.](#)

Dash Enterprise Embedding Middleware

To get started with Enterprise Embedded Middleware, look up the documentation that is included with Dash Enterprise. The URL for the documentation depends on the hostname your administrator has chosen. **[Look up the hostname for your company's license.](#)**

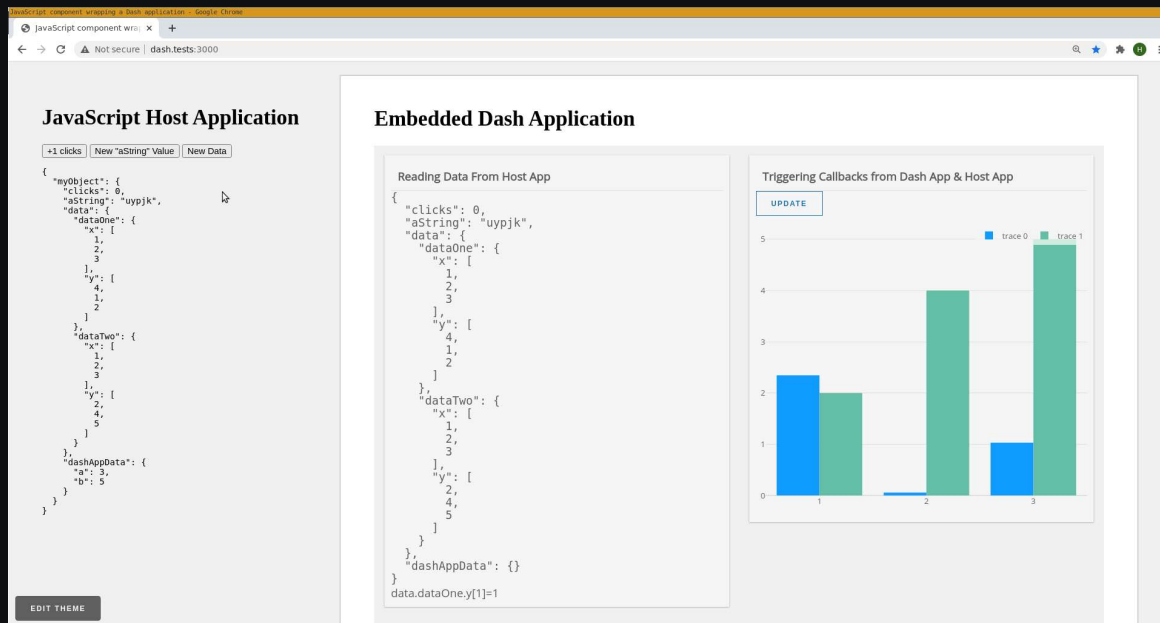

Dash Enterprise provides a first-class capability for embedding Dash apps as a microservice in third party websites and Salesforce.

This capability provides hooks into your existing website's login and authentication logic so that only users who have logged into the existing host web application can view the embedded Dash app.

Sharing State Between a Javascript Host app and an Embedded Dash App

You can find here a simple example illustrating multidirectional shared state, enabling the communication between your JavaScript host app and your Dash app.

Inside your JavaScript host app, you provide the array or object that you want to share to your Dash app as a positional argument in Dash Embedded Components `renderDash()` function:

```
...
var setter = window.dash_embedded_component.renderDash(
  { url_base_pathname: "http://dash.tests:8050" },
  'dash-app',
  sharedData
);
```

If you are using a React app, you can import the component and use it inside JSX:

```
import { DashApp } from "dash-embedded-component";

window.React = React;
window.ReactDOM = ReactDOM;
window.PropTypes = PropTypes;

class App extends React.Component {
  constructor(props) {
    super(props);
    this.state = {
```

```

        sharedData: {
            myObject: {
                clicks: 0,
                aString: randomString(5),
                data: myData,
                multiplyFunc: (x, y) => { ... },
                sumFunc: (x, y) => { ... },
                storeDataFromDash: obj => { ... },
                dashAppData: {}
            },
        },
    };
    this.clickIncrement = this.clickIncrement.bind(this);
    ...
}

render() {
    return (
        <div className="App-Background">
            ...

```

Then inside your Dash app, simply use the

`dash_embedded.ConsumerContext` and `dash_embedded.ConsumerFunction` components consume and use the shared data:

```

...
app.layout = ddk.App(
    [
        ...
        ddk.Card(
            [
                ddk.CardHeader(title="Triggering Callbacks from
                ConsumerContext(id="clicks", path=["myObject",
                ConsumerContext(id="data-one", path=["myObject
                ConsumerContext(id="data-two", path=["myObject
                ...
            ],
            width=50,
        ),
        ddk.ControlCard(
            [
                ddk.CardHeader(title="Triggering Host App Func
                ConsumerFunction(
                    id="host-app-multiply", path=["myObject",

```

```
),
ConsumerFunction(id="host-app-sum", path=["myO
ddk.ControlItem(...),
...
],
width=50,
),
...
]
)
...
```

Embedding Public Apps in Public Websites with `<iframe>`

The simplest approach to embedding Dash in an existing web application is to include an `<iframe>` element in your HTML whose `src` attribute points to the address of a deployed Dash app. This allows you to place your Dash app in a specific location within an existing web page with your desired dimensions:

```
<iframe src="http://localhost:8050" width=700 height=600>
```

Note that this does not work if your application is private and does not integrate with your website's existing authentication or login system. To provide a single sign-on experience, use Dash Enterprise Embedding Middleware.
